

Supplier RFP Response

Orbit Digital

Procurement Request: Enterprise AI-enabled workflow and supplier management platform

Document type: Synthetic / fictional proposal for educational evaluation only

Supplier profile: Strong experience and references; vague integration plan; medium pricing.

Executive Summary

Orbit Digital proposes an enterprise SaaS platform supported by an experienced delivery organization. The supplier demonstrates strong industry experience, credible customer references, and a reasonable support model. Pricing is mid-range. However, the integration approach is described at a relatively high level and several interface and data-migration assumptions require clarification before implementation.

1. Understanding of the Requirement

The procurement team requires a secure, scalable enterprise solution with integration capabilities, a defined implementation approach, transparent commercial assumptions, appropriate security controls, and dependable post-go-live support.

2. Proposed Solution

- Enterprise SaaS platform with configurable modules and workflow capabilities.
- Supports standard REST APIs, secure file-based integration, and common enterprise identity mechanisms.
- Uses managed cloud services to support scalability, availability, monitoring, and operational management.
- A detailed interface inventory and integration design will be completed during the discovery phase.
- Data migration approach will be finalized after assessment of source-system data quality and formats.

3. Implementation Approach

Orbit Digital proposes a phased implementation. Detailed integration design is intentionally deferred to the discovery stage because the current RFP does not provide a complete inventory of source and target systems.

Phase	Duration	Key activities
Planning	3 weeks	Project setup, governance, requirements confirmation
Configuration	10 weeks	Platform configuration and business workflows
Integration	8 weeks	Interfaces, data exchange, integration testing
Testing	4 weeks	System testing, UAT, training
Go-live	3 weeks	Production deployment and stabilization

4. Team Structure and Governance

The proposed team includes a program manager, solution architect, business analysts, configuration specialists, integration engineers, testers, and customer support representatives. Governance will include weekly project reviews, issue and risk tracking, milestone approvals, and executive escalation when required.

5. Commercial Proposal

All amounts below are indicative and expressed in USD. Taxes and customer-specific third-party costs may apply.

Item	Amount (USD)
Implementation	300,000
Integration	85,000
Training	20,000
Annual support	65,000
Year-1 total	470,000

6. Security, Compliance and Risk Controls

- Encryption is supported for data in transit and at rest.
- Role-based access controls and single sign-on support are available.
- Security monitoring and audit logs are available for operational and administrative activities.
- The proposal references established security practices but provides limited certification evidence.
- Detailed privacy, data-retention, and audit requirements will be confirmed during solution design.
- Incident response procedures and escalation processes are included in the supplier's standard service model.

Key Risks / Assumptions

The main risk is that the integration approach is not sufficiently detailed at proposal stage. Additional discovery is required to confirm interface complexity, dependencies, data migration effort, and third-party integration requirements. Final security evidence and detailed privacy controls should also be validated before contract award.

7. Support, Experience and References

- 24x7 support is provided for production-critical incidents.
- A named account manager and technical support team will be assigned.
- Post-go-live stabilization support is included.
- Five relevant customer references across similar enterprise programs are identified.
- Quarterly service reviews and escalation management are included in the proposed support model.

8. Information Requiring Clarification

Before award, the procurement team should request a detailed integration inventory, interface-level architecture, migration assumptions, security certifications or equivalent evidence, service-level targets, and confirmation of third-party licensing responsibilities.

9. Closing Statement

Orbit Digital appreciates the opportunity to respond to this procurement request and confirms its willingness to participate in clarification workshops, technical validation, and commercial negotiations.
